

# CONCEPT MAP

## GENERAL ORGANIC CHEMISTRY

### Nomenclature

#### Rules for nomenclature of branched chain alkanes

- First of all, the longest carbon chain in the molecule is identified.
- The numbering is done in such a way that the branched carbon atoms get the lowest possible numbers.
- If the two substituents are found in equivalent positions, the lower number is given to the one coming first in the alphabetical listing.
- While writing the trivial names of substituents' in alphabetical order, the prefixes *iso*-and *neo*-are considered to be the part of the fundamental name of alkyl group. The prefixes *sec*- and *tert*- are not considered to be the part of the fundamental name.

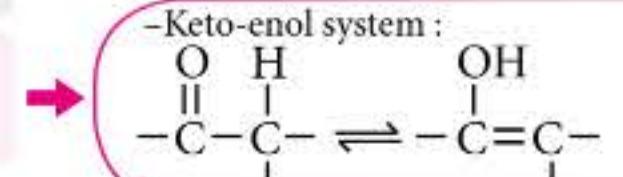

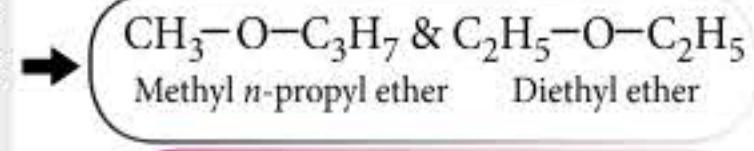

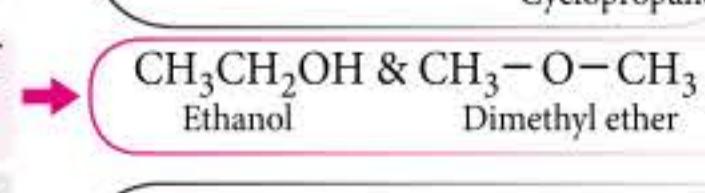

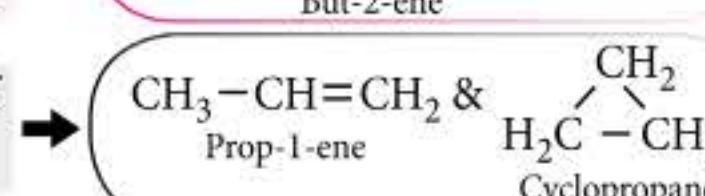

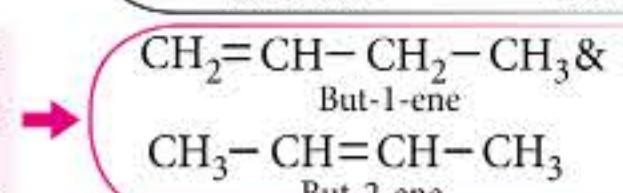

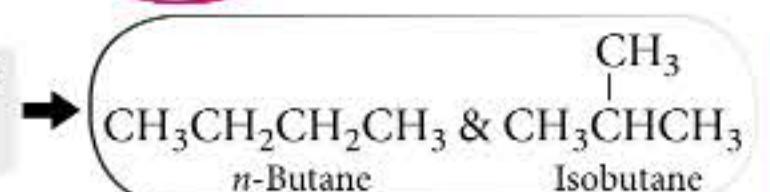

#### Rules for nomenclature of organic compounds with functional groups

- The longest chain of carbon atoms containing the functional group is numbered in such a way that the functional group is attached at the carbon atom possessing lowest possible number in the chain.
- In the case of polyfunctional compounds, one of the functional groups is chosen as the principal functional group and the compound is then named on that basis.
- The order of decreasing priority for some functional groups is :  
 $-\text{COOH} > -\text{SO}_3\text{H} > -\text{COOR} (\text{R} = \text{alkyl group}) > -\text{COCl} > -\text{CONH}_2 > -\text{CN} > \text{C=O} > -\text{O-H} > \text{N-H}_2 > \text{C=C} > \text{C}\equiv\text{C}$

- Different compounds have same molecular formula but different structural formula.
- Compounds have different IUPAC name.

### Structural isomerism or constitutional isomerism

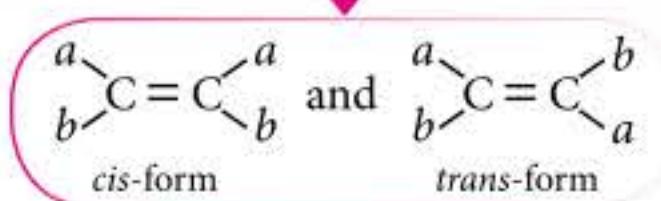

### Isomerism

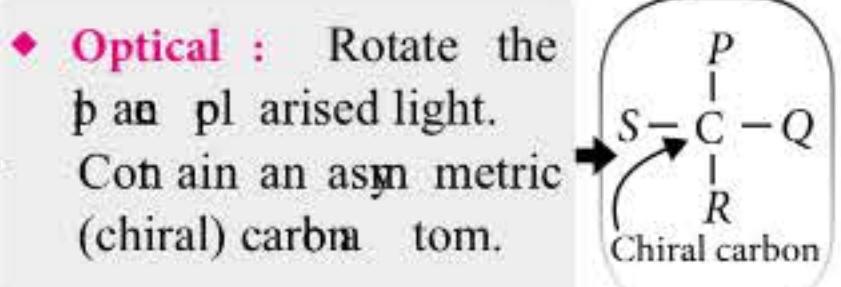

#### Stereo isomerism

- Different compounds have same molecular formula but different arrangement of atoms in space.
- Compounds have same IUPAC name.

Geometrical (*cis-trans*): Molecules have identical atomic structures but different geometries.

Optical : Rotate the plane of polarized light. Contains an asymmetric (chiral) carbon.

### Fundamental Concepts in Organic Reaction Mechanism

#### Fission of a covalent bond

Homolytic fission  
(Similar electronegativity)  
 $\text{C-X} \rightarrow \cdot\text{C} + \cdot\text{X}$   
Free radicals

depends upon the electronegativity

Heterolytic fission  
(Different electronegativity)

$\text{C}^+ + \text{X}^-$   
[Carbocation]  
(Electronegativity, C < X)

$\text{C}^- + \text{X}^+$   
[Carbanion]  
(Electronegativity, C > X)

Polarisation effect (permanent)

#### Electronic displacement

Charged

$\text{H}_3\text{O}^+$ ,  $\text{NO}_2^+$ ,  $\text{NH}_4^+$ ,  $\text{RCO}^+$

Neutral

$\text{BF}_3$ ,  $\text{BeCl}_2$ ,  $\text{SO}_3$ ,  $\text{C}_6\text{H}_5\text{CO}$

Charged

$\text{H}_3\text{O}^+$

Neutral

$\text{R}\ddot{\text{O}}\text{H}$

Charged

$\text{H}_3\text{O}^+$

Neutral

$\text{R}\ddot{\text{O}}\text{H}$

#### Attacking reagent

Ambiphiles

Behave like both electrophiles and nucleophiles

Nucleophiles

Negatively charged or neutral molecules having electron rich atom with unshared electron pair.

Charged

$\text{H}^-$ ,  $\text{OH}^-$ ,  $\text{R}^-$ ,  $\text{CN}^-$

Neutral

$\text{NH}_3$ ,  $\text{H}_2\ddot{\text{O}}$ ,  $\text{R}\ddot{\text{O}}\text{H}$ ,  $\text{R}_3\ddot{\text{N}}$

Polarisability effect (temporary)

Inductive effect : Inductive effect is an electronic effect due to polarisation of  $\sigma$  bonds within the molecular ion. This is typically due to electronegativity difference.

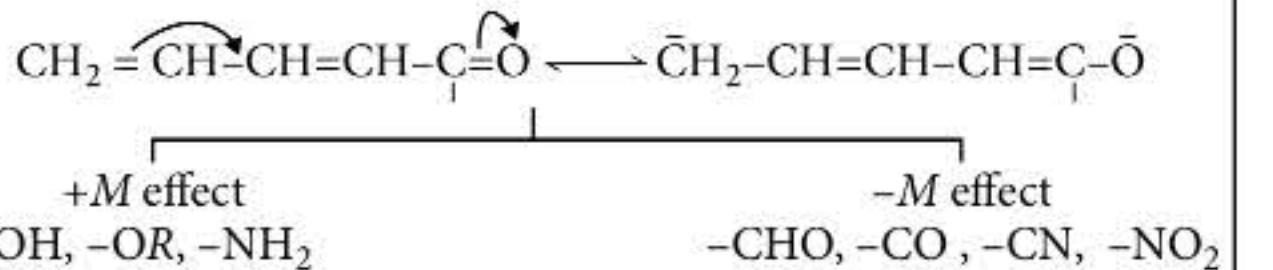

Electron-donating group (Y) exerts a positive inductive effect.

e.g.,  $(\text{CH}_3)_3\text{C}-$ ,  $(\text{CH}_3)_2\text{CH}-$ ,  $\text{CH}_3\text{CH}_2-$ ,  $\text{CH}_3-$

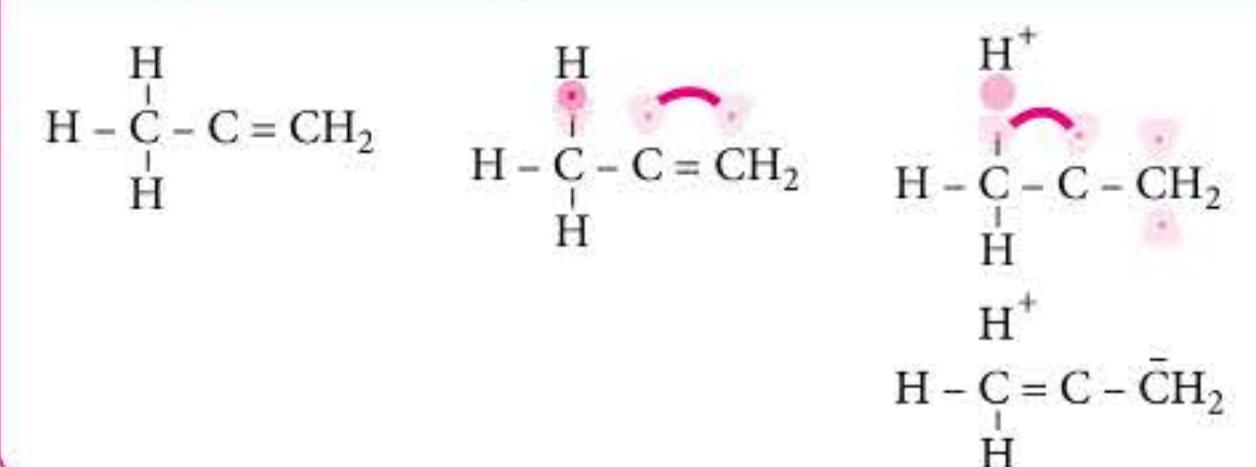

Electron-withdrawing group (X) exerts a negative inductive effect.

e.g.,  $\text{NF}_3$ ,  $\text{NH}_3$ ,  $\text{COOH}$ ,  $\text{F}$ ,  $\text{Cl}$ ,  $\text{Br}$

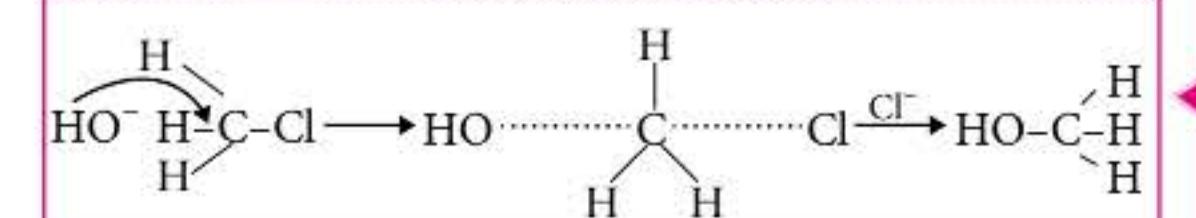

Mesomeric effect : Permanent polarisation of a group conjugated with a  $\pi$ -bond or a set of attached  $\pi$ -bond so that full +ve and -ve charge are developed in the molecule then the effect is known as mesomeric effect.

Hyperconjugative effect (No-bond resonance) : It involves delocalisation of  $\sigma$ -electrons of C-H bond of an alkyl group directly attached to an atom of unsaturated system or to an atom with an unshared  $p$ -orbital.

Inductomeric effect : Inductomeric effect is the temporary effect which enhances the inductive effect and it accounts only in the presence of an attacking reagent.

In methyl chloride the -I effect of Cl is further increased temporarily by the approach of hydroxyl ion.

Electromeric effect : Electromeric effect refers to a molecular polarizability effect occurring by an intramolecular electron displacement characterized by the substitution of one electron pair for another within the same atomic octet of electrons.
